## 1 INTRODUCTION

---

The Woodmark Apartments project site is within the permit boundary of the recently adopted NPDES MS4 Storm Water Permit which regulates discharges into the watershed with the intent to reduce storm water pollution and protect the water quality of our local creeks and waterways and continue to promote groundwater recharge. The City of Sebastopol and the County of Sonoma have adopted the Storm Water Low Impact Development (LID) Technical Design Manual. This Preliminary Storm Water Mitigation Plan (PSWMP) was developed to show compliance with its requirements.

SUSMP requirements are part of the Storm Water Management Plan that is an enforceable part of the reissued municipal storm water National Pollutant Discharge Elimination System (NPDES) permit for the City of Sebastopol, the County of Sonoma and the Sonoma County Water Agency. Satisfying the SUSMP and the NPDES Permit will require meeting the following goals to the maximum extent practicable:

1. Prevent pollutants generated at the site from leaving the site.
2. Prevent increases in Storm Water runoff for the 85<sup>th</sup> percentile 24-hour storm.
3. Strive to maximize the amount of land left in a natural undisturbed condition.

This PSWMP will provide the following information:

- Project Description
- Pollution Prevention Measures
- Types of Best Management Practices (BMPs) selected to mitigate pollutants and provide volume capture
- Responsibility for BMP maintenance
- Location and design of BMPs (on project drawings)

## **2 PROJECT DESCRIPTION**

---

The Woodmark Apartments project site is located at 7716 & 7760 Bodega Avenue. The property is located within the City of Sebastopol.

The Woodmark Apartments property contains an area of 3.59 acres and is the merger of two assessor parcels, APN 060-230-067 and APN 004-211-007. Each existing parcel contains a single family residence, peripheral structures and the remnants of an orchard.

The project is proposed by Sebastopol Pacific Associates as a dual-phased project. A total of 84 one-to-three bedroom units will be built in the six proposed buildings, along with a pergola, tot lot and bocce ball court.

The project will collect overland flow and route it to a series of proposed bio-retention beds with volume capture underground before entering the underground drainage system. This pre-treatment design feature shall not only remove pollutants, but also will reduce the amount of runoff by capturing and infiltrating storm water onsite. The bio-retention beds are proposed at various locations throughout the project site, providing treatment for the on-site tributaries. The purpose of these devices and their effect on the quality and quantity of runoff leaving the developed site will be further explained throughout this report.

The attached plan titled "Proposed PSWMP Exhibit" shows the proposed grading pattern for the project along with the tributary drainage areas and proposed bio-retention beds. Accompanying the plan are typical storm water bio-retention with volume capture details.

### **3 POLLUTION PREVENTION MEASURES**

---

The roof drains of the apartment buildings will be disconnected from the storm drain system and some will surface flow to onsite bio-retention beds.

The project will incorporate a robust Landscape plan including interceptor trees that will be planted throughout the project.

The total tributary area used for volume capture calculations has been reduced by taking credit for disconnected roof drains and interceptor trees.

#### **4 TYPES OF BMP'S SELECTED TO MITIGATE POLLUTANTS AND PROVIDE VOLUME CAPTURE**

---

Best Management Practices (BMP's) are design features that address the quality and quantity of the storm waters that flow from a development. In most cases, these BMP's are used to mitigate a development's impact on the quality of storm water by treating or cleaning the storm water. Some controls have dual treatment control measure capabilities, not only treating, but also containing a required volume of storm water. The Woodmark Apartments project will implement bio-retention beds to mitigate pollutants and provide volume capture for the 85<sup>th</sup> percentile 24-hour storm. Volume capture is accomplished by incorporating an area for storm water storage beneath the bio-retention beds.

Bio-retention beds have been selected for this project because of their ability to remove pollutants through a variety of natural physical, biological and chemical treatment processes. These BMP's are considered a Low Impact Development (LID) device for treatment control. They have also been selected because they provide an excellent opportunity for the runoff to settle any suspended solids and remove hydrocarbons. Both of which have been identified as pollutants that can degrade the downstream receiving waters of the project. Compared to pipe networks, bio-retention beds with gravel storage areas will reduce runoff from the site and provide ground water recharge. For this project we have selected structural soil consisting of ¾ inch to 1-1/2 inch aggregate for the storage area which has a porosity of 30%. The structural soil will also provide an environment for landscaping to thrive. These mitigation measures provide the opportunity to reduce the peak flow in a basin. This project meets the Design Goal by achieving 100% volume capture.

## **5 RESPONSIBILITY FOR BMP MAINTENANCE**

---

Treatment control devices serving the Woodmark Apartments project are located onsite. The property management company will be responsible for the surface and sub-surface oversight and maintenance of the treatment control devices located on the property.

Attached is a Draft of the Declaration of Covenants Regarding Maintenance of Storm Water BMP Facilities.

# 2017 Storm Water LID Determination Worksheet

**PURPOSE AND APPLICABILITY:** This determination worksheet is intended to satisfy the specific requirements of "ORDER NO. R1-2015-0030, NPDES NO. CA0025054 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS." Additional design requirements imposed by Governing Agencies, such as local grading ordinances, CAL Green, CEQA, 401 permitting, and hydraulic design for flood control still apply as appropriate. Additionally, coverage under another regulation may trigger the requirement to design in accordance with the Storm Water LID Technical Design Manual.

## Type of Application/Project:

- Subdivision   
  Grading Permit   
  Building Permit   
  Hillside Development  
 Design Review   
  Use Permit   
  Encroachment   
  Time Extensions   
 Other : \_\_\_\_\_

## PART 2: Project Exemptions

- Is this a project that creates or replaces *less than* 10,000 square feet of impervious surface<sup>1</sup>, including all project phases and off-site improvements?

Yes   
  No

<sup>1</sup> Impervious surface replacement, such as the reconstruction of parking lots or excavation to roadway subgrades, is not a routine maintenance activity. Reconstruction is defined as work that replaces surfaces down to the subgrade. Overlays, resurfacing, trenching and patching are defined as maintenance activities per section VI.D.2.b.

2. Is this project a routine maintenance activity<sup>2</sup> that is being conducted to maintain original line and grade, hydraulic capacity, and original purpose of facility such as resurfacing existing roads and parking lots?

Yes  No

3. Is this project a stand alone pedestrian pathway, trail or off-street bike lane?

Yes  No

4. **Did you answer "YES" to any of the questions in Part 2?**

**YES:** This project will *not* need to incorporate permanent Storm Water BMP's as required by the NPDES MS4 Permit. **Please complete the "Exemption Signature Section" on Page 4.**

**NO:** Please complete the remainder of this worksheet.

### **Part 3: Project Triggers**

#### **Projects that Trigger Requirements:**

Please answer the following questions to determine whether this project requires permanent Storm Water BMP's and the submittal of a SW LIDs as required by the NPDES MS4 Permit order No. R1-2015-0030.

1. Does this project create or replace a combined total of 10,000 square feet or more of impervious surface<sup>1</sup> including all project phases and off-site improvements?

Yes  No

2. Does this project create or replace a combined total or 10,000 square feet or more of impervious streets, roads, highways, or freeway construction or reconstruction<sup>3</sup>?  Yes  No

3. Does this project create or replace a combined total of 1.0 acre or more of impervious surface<sup>1</sup> including all project phases and off-site improvements?  Yes  No

4. **Did you answer "YES" to any of the above questions in Part 3?**

**YES:** This project will need to incorporate permanent Storm Water BMP's as required by the NPDES MS4 Permit. **Please complete remainder of worksheet and sign the "Acknowledgement Signature Section" on Page 4.**

**NO:** This project will *not* need to incorporate permanent Storm Water BMP's as required by the NPDES MS4 permit. **Please complete the "Exemption Signature Section" on Page 4.**

<sup>1</sup> Impervious surface replacement, such as the reconstruction of parking lots or excavation to roadway subgrades, is not a routine maintenance activity. Reconstruction is defined as work that replaces surfaces down to the subgrade. Overlays, resurfacing, trenching and patching are defined as maintenance activities per section VI.D.2.b.

<sup>2</sup> "Routine Maintenance Activity" includes activities such as overlays and/or resurfacing of existing roads or parking lots as well as trenching and patching activities and reroofing activities per section VI.D.2.b.

<sup>3</sup> "Reconstruction" is defined as work that extends into the subgrade of a pavement per section VI.D.2.b.

**Part 4: Project Description**

1. Total Project area:   square feet  
 acres

2. Existing land use(s): (check all that apply)

Commercial  Industrial  Residential  Public  Other

Description of buildings, significant site features (creeks, wetlands, heritage trees), etc.:

The project site contains two assessor parcels, APN 060-230-067 and APN 004-211-007, which will be merged. Each existing parcel contains a single family residence, peripheral structures and the remnants of an orchard. Heritage oak trees along the north and northwest boundary will be preserved.

3. Existing impervious surface area:   square feet  
 acres

4. Proposed Land Use(s): (check all that apply)

Commercial  Industrial  Residential  Public  Other

Description of buildings, significant site features (creeks, wetlands, heritage trees), etc.:

The project proposes to construct a total of 84 one-to-three bedroom units built in the six proposed buildings, along with a pergola, tot lot, bocce ball court, and vehicular driveway and parking spaces to support the development.

5. Existing impervious surface area:   square feet  
 acres

**Acknowledgment Signature Section:**

As the property owner or developer, I understand that this project is required to implement permanent Storm Water Best Management Practices and provide a Storm Water Low Impact Development Submittal (SW LIDS) as required by the City's National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer Systems (MS4) Permit Order No. R1-2015-0030. \*Any unknown responses must be resolved to determine if the project is subject to these requirements.

Applicant Signature

Date

**Exemption Signature Section:**

As the property owner or developer, I understand that this project as currently designed does not require permanent Storm Water BMP's nor the submittal of a Storm Water Low Impact Development Submittal (SW LIDS) as required by the City's National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer Systems (MS4) Permit\*. I understand that redesign may require submittal of a new Determination Worksheet and may require permanent Storm Water BMP's.

- \* This determination worksheet is intended to satisfy the specific requirements of "ORDER NO. R1-2015-0030, NPDES NO. CA0025054 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS." Additional design requirements imposed by Governing Agencies, such as local grading ordinances, CAL Green, CEQA, 401 permitting, and hydraulic design for flood control still apply as appropriate. Additionally, coverage under another regulation may trigger the requirement to design in accordance with the Storm Water LID Technical Design Manual.

**Implementation Requirements:** All calculations shall be completed using the "Storm Water Calculator" available at: [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID)

**Hydromodification Control/100% Volume Capture:** Capture (infiltration and/or reuse) of 100% of the volume of runoff generated by a 1.0" 24-hour storm event, as calculated using the "Urban Hydrology for Small Watersheds" TR-55 Manual method. This is a retention requirement.

**Treatment Requirement:** Treatment of 100% of the flow calculated using the modified Rational Method and a known intensity of 0.20 inches per hour.

**Delta Volume Capture Requirement:** Capture (infiltration and/or reuse) of the increase in volume of storm water due to development generated by a 1.0" 24-hour storm event, as calculated using the "Urban Hydrology for Small Watersheds" TR-55 Manual method. This is a retention requirement.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sonoma County, California

Survey Area Data: Version 14, May 29, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jul 1, 2018—Jul 31, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
GdD	Goldridge fine sandy loam, 9 to 15 percent slopes	2.0	56.5%
SbD	Sebastopol sandy loam, 9 to 15 percent slopes	1.5	43.5%
<b>Totals for Area of Interest</b>		<b>3.5</b>	<b>100.0%</b>

## Sonoma County, California

### GdD—Goldridge fine sandy loam, 9 to 15 percent slopes

#### Map Unit Setting

*National map unit symbol:* hfcz

*Elevation:* 200 to 2,000 feet

*Mean annual precipitation:* 40 inches

*Mean annual air temperature:* 57 degrees F

*Frost-free period:* 225 to 240 days

*Farmland classification:* Not prime farmland

#### Map Unit Composition

*Goldridge and similar soils:* 85 percent

*Minor components:* 15 percent

*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Goldridge

##### Setting

*Landform:* Hills

*Landform position (two-dimensional):* Backslope

*Landform position (three-dimensional):* Side slope

*Down-slope shape:* Concave

*Across-slope shape:* Convex

*Parent material:* Residuum weathered from sandstone

##### Typical profile

*H1 - 0 to 24 inches:* fine sandy loam

*H2 - 24 to 28 inches:* sandy clay loam

*H3 - 28 to 72 inches:* sandy clay loam

##### Properties and qualities

*Slope:* 9 to 15 percent

*Depth to restrictive feature:* More than 80 inches

*Drainage class:* Moderately well drained

*Runoff class:* Medium

*Capacity of the most limiting layer to transmit water*

*(Ksat):* Moderately high (0.20 to 0.57 in/hr)

*Depth to water table:* More than 80 inches

*Frequency of flooding:* None

*Frequency of ponding:* None

*Available water capacity:* Moderate (about 8.7 inches)

##### Interpretive groups

*Land capability classification (irrigated):* 4e

*Land capability classification (nonirrigated):* 4e

*Hydrologic Soil Group:* C

*Hydric soil rating:* No

### **Minor Components**

#### **Cotati**

*Percent of map unit: 5 percent*

*Hydric soil rating: No*

#### **Sebastopol**

*Percent of map unit: 5 percent*

*Hydric soil rating: No*

#### **Blucher**

*Percent of map unit: 5 percent*

*Hydric soil rating: No*

## **Data Source Information**

Soil Survey Area: Sonoma County, California

Survey Area Data: Version 14, May 29, 2020

## Sonoma County, California

### SbD—Sebastopol sandy loam, 9 to 15 percent slopes

#### Map Unit Setting

*National map unit symbol:* hfjd  
*Elevation:* 100 to 1,000 feet  
*Mean annual precipitation:* 40 inches  
*Mean annual air temperature:* 55 degrees F  
*Frost-free period:* 200 to 240 days  
*Farmland classification:* Not prime farmland

#### Map Unit Composition

*Sebastopol and similar soils:* 85 percent  
*Minor components:* 15 percent  
*Estimates are based on observations, descriptions, and transects of the mapunit.*

#### Description of Sebastopol

##### Setting

*Landform:* Terraces  
*Landform position (two-dimensional):* Backslope  
*Landform position (three-dimensional):* Side slope  
*Down-slope shape:* Concave  
*Across-slope shape:* Convex  
*Parent material:* Alluvium derived from sedimentary rock

##### Typical profile

*H1 - 0 to 8 inches:* sandy loam  
*H2 - 8 to 12 inches:* sandy clay loam  
*H3 - 12 to 43 inches:* clay  
*H4 - 43 to 62 inches:* clay loam  
*H5 - 62 to 72 inches:* sandy clay loam

##### Properties and qualities

*Slope:* 9 to 15 percent  
*Depth to restrictive feature:* More than 80 inches  
*Drainage class:* Well drained  
*Runoff class:* Very high  
*Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)  
*Depth to water table:* More than 80 inches  
*Frequency of flooding:* None  
*Frequency of ponding:* None  
*Available water capacity:* High (about 9.1 inches)

##### Interpretive groups

*Land capability classification (irrigated):* 4e  
*Land capability classification (nonirrigated):* 4e  
*Hydrologic Soil Group:* C  
*Hydric soil rating:* No

### **Minor Components**

#### **Blucher**

*Percent of map unit:* 4 percent

*Hydric soil rating:* No

#### **Goldridge**

*Percent of map unit:* 4 percent

*Hydric soil rating:* No

#### **Cotati**

*Percent of map unit:* 4 percent

*Hydric soil rating:* No

#### **Pajaro**

*Percent of map unit:* 3 percent

*Hydric soil rating:* No

## **Data Source Information**

Soil Survey Area: Sonoma County, California

# FACT SHEET- IMPERVIOUS AREA DISCONNECTION

## *Runoff Reduction Measure*

### IMPERVIOUS AREA DISCONNECTION

Including: splash blocks, rain chains, bubble up emitters, and pavement disconnection.

### OVERVIEW

Impervious area disconnection allows storm water from impervious areas, such as rooftops and pavement, to be directed to pervious natural or landscaped areas and infiltrate into the soil. Impervious surfaces that drain directly to catch basins or storm drains are a directly connected impervious area. These areas prevent storm water infiltration into the soil or filtering through vegetation and soil. Impervious areas also increase the speed and amount of runoff from a site, which may contribute to peak flows and scour in downstream creeks and waterways.

This BMP addresses these issues by disconnecting direct discharges by using: splash blocks, bubble-up emitter, and paved area disconnection.

### ***DOWNSPOUT DISCONNECTION- DESCRIPTION***

Disconnecting downspouts and using splash blocks or rain chains is a low tech option to hard piped downspout systems. Existing downspouts can be retrofitted.

### ADVANTAGES

- Reduces the size of downstream storm water BMPs.
- Can be used on sloped sites.
- Increases infiltration potential.
- Increases time of concentration.

# FACT SHEET- IMPERVIOUS AREA DISCONNECTION

- Can be used as a retrofit BMP.

## LIMITATIONS

- Adjacent buildings need to be considered in design.
- Ultimate storm water collection needs to be considered in design.
- May not be appropriate on all sites due to space constraints.

## KEY DESIGN FEATURES

- Sites should be evaluated to ensure disconnecting downspouts won't have negative impacts.
- Rain water must be directed away from foundations and footings.
- Downspouts should not be directed to paved areas or across sidewalks.
- Landscaped areas receiving roof water should be adequately sized to prevent runoff or erosion and to allow for infiltration.
- All calculations shall be completed using the "Storm Water Calculator" available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

## ***BUBBLE-UP EMITTER-DESCRIPTION***

Bubble-up emitters work very much like disconnected downspouts with splash blocks, but allow for storm water to be released further from the building or into landscape areas that are not directly adjacent to the building.

## ADVANTAGES

- Reduces the size of downstream storm water BMPs.
- Takes water away from buildings.
- Increases infiltration potential.
- Increases time of concentration.
- Can be used as a retrofit BMP.

## LIMITATIONS

- Adjacent buildings need to be considered in design.
- Ultimate storm water collection needs to be considered in design.
- May not be appropriate on all sites due to space constraints.

## KEY DESIGN FEATURES

- Rain water must be directed away from foundations and footings.
- Downspouts should not be directed to paved areas or across sidewalks.
- 4" diameter SDR-35 pipe required as a minimum.

# FACT SHEET- IMPERVIOUS AREA DISCONNECTION

## *Runoff Reduction Measure*

- Distance and location of emitter relative to the building must be approved by a Licensed Geotechnical Engineer.
- Landscaped areas receiving roof water should be adequately sized to prevent runoff or erosion and allow for infiltration.
- Landscaped areas receiving roof water need to be designed to ensure proper drainage and to prevent ponding water.
- May be installed with a bottomless emitter to allow for infiltration. Bottom of emitter should be placed over drain rock to prevent sedimentation of pipe.
- Emitter should be equipped with “pop up” cover to prevent mosquito breeding.
- All calculations shall be completed using the “Storm Water Calculator” available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

### ***PAVED AREA DISCONNECTION-DESCRIPTION***

Paved areas that can be graded so that they drain onto pervious area, such as landscape or natural area can increase the opportunity for infiltration and minimize the size of downstream treatment.

### **ADVANTAGES**

- Reduces the size of downstream storm water BMPs.
- Increases infiltration potential.
- Increases time of concentration.

### **LIMITATIONS**

- Areas receiving flow need to be adequately sized and stabilized.
- Ultimate storm water collection needs to be considered in design.
- May not be appropriate on all sites due to space constraints.
- May be limited by site slopes.

### **KEY DESIGN FEATURES**

- Rain water must be directed away from foundations and footings.
- Downspouts should not be directed to paved areas or across sidewalks.
- Landscaped areas receiving roof water should be adequately sized to prevent runoff or erosion and to allow for infiltration.
- All calculations shall be completed using the “Storm Water Calculator” available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

# FACT SHEET- INTERCEPTOR TREES

## *Runoff Reduction Measure*

### INTERCEPTOR TREES

Also known as: Tree Credits

### DESCRIPTION

Interceptor trees are new or existing trees with their trunks located within 25' of impervious areas. Trees intercept rain water on their leaves and branches, allowing rain water to evaporate or run down the branches and trunk of the tree where it readily infiltrates into the soil. Tree roots also increase infiltration. Trees also provide shade over impervious surfaces which reduce peak flow in streams and provide shade which reduces the “heat island” effects of urban areas.

Interceptor tree credits are calculated into the site design by reducing the amount of tributary area that must be used to calculate treatment and volume capture. New deciduous trees provide a credit of 100 ft<sup>2</sup>, new evergreen trees provide 200 ft<sup>2</sup>, and existing trees provide one half of the existing canopy. The total area reduction credit due to the use of interceptor trees cannot exceed one half of the total physical tributary area. All calculations shall be completed using the “Storm Water Calculator” available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

# FACT SHEET- INTERCEPTOR TREES

---

## ADVANTAGES

- Reduces the size of downstream storm water BMPs.
- Enhances water quality of downstream water bodies through natural processes.
- Aesthetically pleasing.
- Provides shade to cool pavement and reduces surface runoff temperatures.
- Aids in removal of air pollutants and noise reduction.
- Trees required by the permitting agency may be counted as interceptor trees.
- Establishes habitat for birds and other pollinators like butterflies and bees.

## KEY DESIGN FEATURES

- Appropriate new trees must be selected from the approved **Tree List** included in Appendix G.
- Existing trees must be adequately protected during construction.
- Only tree that overhang impervious areas or whose trunks are within 25' of impervious areas can qualify as interceptor trees.
- All calculations shall be completed using the "Storm Water Calculator" available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

## INSPECTION AND MAINTENANCE REQUIREMENTS

A maintenance plan shall be provided with the Final SWLID Submittal. The maintenance plan shall include recommended maintenance practices, state the parties responsible for maintenance and upkeep, specify the funding source for ongoing maintenance with provisions for full replacement when necessary, and provide site specific inspection checklist.

At a minimum inspection and maintenance shall include the following:

- Annual inspection prior to the rainy season.
- Annual proper watering and application of mulch.
- Routine pruning and weeding as needed.
- Replacement of trees as needed.

# FACT SHEET- BIORETENTION

---

## BIORETENTION

Also known as: Rain garden, roadside bioretention, and bioretention cell

## DESCRIPTION

The bioretention area best management practice (BMP) functions as a soil and plant-based filtration and infiltration feature that removes pollutants through a variety of natural physical, biological, and chemical treatment processes.

## ADVANTAGES

- Can be designed to achieve Treatment, Delta Volume Capture, or Hydromodification requirements.
- Enhances water quality of downstream water bodies through natural processes.
- Aesthetically pleasing.
- The vegetation can provide shade and wind breaks, absorbs noise, reduces heat island effects and improves an area's landscape.
- Provides habitat for birds and attracts other pollinators like butterflies and bees.
- Does not interrupt utility installation.
- Does not interfere with tree planting.

# FACT SHEET- BIORETENTION

---

## LIMITATIONS

- Specialized design is required for areas where street slopes exceed 10%.
- Should not be used in areas of known contamination. If soil and/or groundwater contamination is present on the site or within a 100' radius of the proposed BMP location, the North Coast Regional Water Quality Control Board will need to be contacted and the site reviewed.
- Should not be used in areas of high groundwater. In general a minimum of 2' of clearance should be provided between the bottom of the bioretention cell and seasonal high groundwater.
- Should not be used in areas of slope instability where infiltrated storm water may cause failure. Slope stability should be determined by a licensed geotechnical engineer.
- Do not use in locations that can negatively impact building foundation or footings. Location shall be approved by a licensed Geotechnical Engineer.

## KEY DESIGN FEATURES

### ALL BIORETENTION

- Structural soil should be used within the bioretention area requiring load bearing capacity (adjacent to roadways and/or buildings).
- Structural soil, if used, shall be installed as described in Appendix E.
- Some BMPs may not require the use of structural soil and a more organic type planting soil and/or treatment media may be used in its place. It may be possible in some cases to use native soil or to amend the native soil so that it is suitable. Use of non-structural soil will depend on evaluation of the criteria in "Chapter 4-Site Assessment" as well as consideration of structural needs and may require evaluation by a licensed Geotechnical Engineer.
- Underlying native soil should remain un-compacted to preserve infiltration capacity. Fence off the area during construction to protect it from compaction.
- Bottom of bioretention should be un-lined to allow infiltration into native soil.
- Moisture barrier must be installed vertically to protect road sub-base and any trenches adjacent to the bioretention area.
- If used, pervious concrete shall be designed and installed as described in Appendix E and protected during construction to prevent sediment loading.
- If the porous gutter design option is used additional trash and sediment capture BMPs is required.
- A curb opening type design may be used in place of a porous gutter if appropriate for the project and does not require additional trash capture.
- Bioretention areas shall be planted with plants from the approved **Plant List** and **Tree List** included in Appendix F and shall be planted to achieve 51% cover.
- All bioretention areas shall be designed with a designated high flow bypass inlet for storms larger than the design storm.

# FACT SHEET- BIORETENTION

---

- For designs that include perforated pipe, the 6” perforated pipe must be installed a minimum of 6” below the adjacent road structural section.
- Perforated pipe shall be installed in straight runs only.
- The volume below the perforated pipe must be sufficient to hold and infiltrate the design volume.

## SIZING DESIGN- GOAL AND REQUIREMENTS

- **For all projects:** The treatment component requires that all of the runoff generated by this water quality design storm from impermeable surfaces must be treated on site for the pollutants of concern.
- **For projects that increase the amount of impervious surface, but create or replace less than a total of one acre:** The **Delta Volume Capture** component requires that any increase in volume due to development for the water quality design storm must be infiltrated and/or reused on site. Further discussion of the Treatment and Delta Volume Capture requirements and the accompanying formulas can be found in Chapter 6.
- **For projects that create or replace one acre or more of impervious surface:** These larger projects must mitigate their impacts by meeting the **Hydromodification Requirement** by capturing 100% of the post development volume generated by the water quality rain event.
- All calculations shall be completed using the “Storm Water Calculator” available at [www.srcity.org/stormwaterLID](http://www.srcity.org/stormwaterLID).

## INSPECTION AND MAINTENANCE REQUIREMENTS

A maintenance plan shall be provided with the Final SWLID Submittal. The maintenance plan shall include recommended maintenance practices, state the parties responsible for maintenance and upkeep, specify the funding source for ongoing maintenance with provisions for full replacement when necessary and provide site specific inspection checklist.

At a minimum maintenance shall include the following:

- Dry street sweeping upon completion of construction
- Dry street sweeping annually, and
  - When water is observed flowing in the gutter during a low intensity storm.
  - Algae is observed in the gutter.
  - Sediment/debris covers 1/3 of the gutter width or more.
- Inspect twice annually for sedimentation and trash accumulation in the gutter. Obstructions and trash shall be removed and properly disposed of.
- Inspect twice during the rainy season for ponded water.
- Pesticides and fertilizers shall not be used in the bioretention area.
- Plants should be pruned, weeds pulled and dead plants replaced as needed.

---

**STANDARD MAINTENANCE AND MONITORING AGREEMENT  
STORMWATER BMP FACILITIES MAINTENANCE/MONITORING AGREEMENT**

THIS AGREEMENT is made and entered into this            day of            20    , by and between Sebastopol Pacific Associates (Landowner), and City of Sebastopol (City)

**RECITALS**

WHEREAS, Landowner is the owner of certain real property described in Exhibit A, attached hereto and incorporated as though fully set forth herein (Property); and

WHEREAS, Landowner has submitted an application and development plan (Plan) for the Property within the City of Santa Rosa, for which Landowner has received final approval from the City, which Plan is incorporated as though fully set for the herein; and

WHEREAS, The North Coast Regional Water Quality Control Board NPDES Permit, Order #31-2009-0050, requires City to implement and enforce specific requirements for construction and maintenance of onsite stormwater management/Best Management Practices (BMP) for public and private construction; and

WHEREAS, City requires that on-site stormwater management/BMP facilities shall be constructed and maintained by Landowner in accordance with Plan specifications.

WHEREAS, the Plan provides for Bio-retention and Volume Capture BMP's; and

**AGREEMENT**

NOW, THEREFORE, in consideration of the foregoing recitals, the mutual covenants contained herein, and the following terms and conditions, the parties agree as follows:

1. The on-site stormwater management/BMP facilities shall be constructed by Landowner in accordance with the Plan specifications.
2. Landowner shall maintain the stormwater management/BMP facilities in good work condition acceptable to the City.

3. Landowner hereby grants permission to City, its authorized agents and employees, to enter upon the property and to inspect the stormwater management/BMP facilities whenever City deems necessary. The purpose of the inspection is to assure safe and proper functioning of the facilities. The inspection shall cover the entire facilities, including any berms, inlet and outlet structures, vegetation, infiltration media, pond areas, access roads, et cetera. If deficiencies are noted, City shall notify Landowner and provide the inspection findings and evaluations. (and cure requirements?)
4. Landowner hereby grants permission to City, its authorized agents, employees, and consultants to enter upon the property to install, operate and maintain equipment to monitor the flow characteristics and pollutant content of the influent, effluent and intermediate points in the facilities. Landowner further agrees to design and construct the facility to provide access for monitoring as outlined in Storm Water Mitigation Plan and/or in the manufacturer manual for the BMP.
5. Landowner will perform maintenance and an annual maintenance inspection in accordance with the maintenance schedule for the stormwater management/BMP facilities, including sediment removal, as outlined in the Plan and the following specific requirements:

Maintenance of the following BMP(s)

Shall conform to the approved Plan's maintenance requirements, all requirements contained in (cite handbooks) and/or specific maintenance requirements established by the manufacturer as approved by (City dept.) prior to the release of the final plans. Specific manufacturer maintenance requirements for the BMP will be submitted to the City.

6. In the event Landowner fails to maintain the stormwater management/BMP facilities in good working condition acceptable to City, City may enter upon the Property and take whatever steps it deems reasonably necessary to maintain the stormwater management/BMP facilities. This provision shall not be construed to allow City to erect any structure of a permanent nature on the Property outside of an easement in favor of City. It is expressly understood and agreed that City is under no obligation to maintain or repair facilities, and in no event shall this Agreement be construed to impose such an obligation on City.
7. In the event that City, pursuant to this Agreement, performs work of any nature, or expends any funds in the performance of such work for labor, use of equipment, supplies, materials, and the like, due to the failure of Landowner to perform such maintenance or work, Landowner shall reimburse City within 30 days of receipt of notice of all costs incurred by the City to undertake such work. If Landowner fails to reimburse City for these costs within 30 days, City shall have a lien against the property in the amount of such costs, plus the legal rate of interest for judgments, and

may enforce the lien in the same manner a lien for real property taxes may be enforced.

8. Landowner shall indemnify, defend and hold harmless City and its employees, officials, and agents, from and against any liability, (including liability for claims, suits, actions, arbitration proceedings, administrative proceedings, regulatory proceedings, losses, expenses or costs of any kind, whether actual, alleged or threatened, interest, defense costs, and expert witness fees), where same results from or arises out of the construction, presence existence, or maintenance of the stormwater management/BMP facilities or the performance of this Agreement by Landowner, its officers, employees, agents, and sub-contractors, excepting only that resulting from the sole, active negligence or intentional misconduct of City, its employees, officials, or agents. This indemnification obligation is not limited in any way by any limitation on the amount or type of damages or compensation payable to or for Landowner or its agents under workers' compensation acts, disability benefits acts or other employees' benefits acts. In the event a claim is asserted against City, its agents or employees', City shall promptly notify landowner. Thereafter, Landowner shall defend at its own expense any suit based upon such claim. If any judgment or claim against the City, its agents or employees', shall be entered, Landowner shall pay all costs and expenses in connection therewith.
9. If any provisions of the Agreement shall be held to be invalid, illegal or unenforceable, the validity, legality and enforceability of the remaining provision shall not in anyway be affected or impaired thereby.
10. This Agreement shall be governed according to the laws of the State of California. Because this Agreement is to be performed in the County of Sonoma, the parties hereto agree that the forum for the adjudication of any dispute regarding the Agreement or enforcement shall be brought exclusively and solely in Sonoma County, California.
11. City and Landowner each binds itself, its partners, successors, legal representatives and assigns to the other party to this Agreement and to the partners, successors, legal representatives and assigns of such other parties with respect to all promises and agreements contained herein.
12. This Agreement shall be recorded, and shall constitute a covenant running with the land, or equitable servitude, and shall be binding upon and insure to the benefit of Landowner's successors and assigns.
